

Project SpaceRF - Components & Use

- **NE5534P Amplification Engine:** Low-noise integrated circuit that multiplies microvolt radio signals from space into clear audio data.
- **Antenna Deck & Counterpoise:** The 0.62m telescoping rod captures incoming waves, while the 1.5m wire acts as an electrical ground plane mirror.
- **1N4148 Static Electricity Guard:** Dual cross-flipped diodes that act as lightning trapdoors, dumping high-voltage static safely into ground.
- **4.5V Virtual Ground Rail:** Two 10kΩ resistors split the 9V battery in half, allowing full AC radio wave swing without signal clipping.
- **47µF Isolation Capacitor & Output Jack:** Blocks raw battery voltage from bleeding forward, passing clean space data directly to the phone.
